

### Products

**Bolt Anchor AN BZ PLUS**

**Drive Plug AN ES**

**Setting Tool for Drive Plug ANT**

**Resin Anchor Rod VMZ-A  
Resin Anchor Rod VMU-A**

**Resin Injection Cartridge VMZ 345; VMU; VM-K / Perforated Sleeve SH**

**Assessories VMZ; VMU; VM-K**

Dispenser; Steel brush; Blow-out Pump

**Screwbolt TSM-ST**

**Screwbolt TSM-LP VZ 30  
Screwbolt TSM-IM**

**Hollow Core Anchor AN Easy**

**Nail Anchor PN 27**

**Nylon Plug AN**

### Products

**Rod Coupling AD f/f**

IG/IG; round

**Reducer AD f/m**

**Reducer AD m/f**

**Eye Bolt SCR**

**Flat Leaf Bolt SCR**

**Link Eye SCB**

**Eye Screw SCR  
Eye Screw C RIN C**

**Twin Holder DHP M8**

**Threaded Spacer BOL M8**

**Hexagon Wood Screw SKH**

**Slotted Screw SCR**

**Hexagon Bolt SKT**

### Products

Hexagon Nut NT

Flange Nut NT FLA

Threaded Rod GST  
Threaded Stud GST

Locking Nut NT G

Threaded Tube GR

Grooved Rod GES PNS

Bolt Screw BSCR with collar

Hexagon Socket Screw SCR

Washer US

Bolt Screw BSCR without collar

Flange Screw FLA HCP

Bolt Screw Adapter ANT BIT

### Load details for Bolts, Threaded Rods, Threaded Tube

#### Bolts and Threaded Rods

FK = Grade  
 $\mu_{ges} = 0.14$

$\sigma_{adm} \leq 215 \text{ N/mm}^2$  (FK 4.8)  
 $f_{adm} \leq 3 \text{ mm}$

Thread	Permissible Load (tension) [kN]			Torque [Nm]	
	FK 4.8	FK 8.8	VA	FK 4.8	FK 8.8
M 8	8.0	15.6	4.6	12	25
M10	12.5	24.7	7.4	23	50
M12	18.1	35.9	10.8	40	85
M16	33.8	66.7	20.0	100	210

#### Threaded Tube

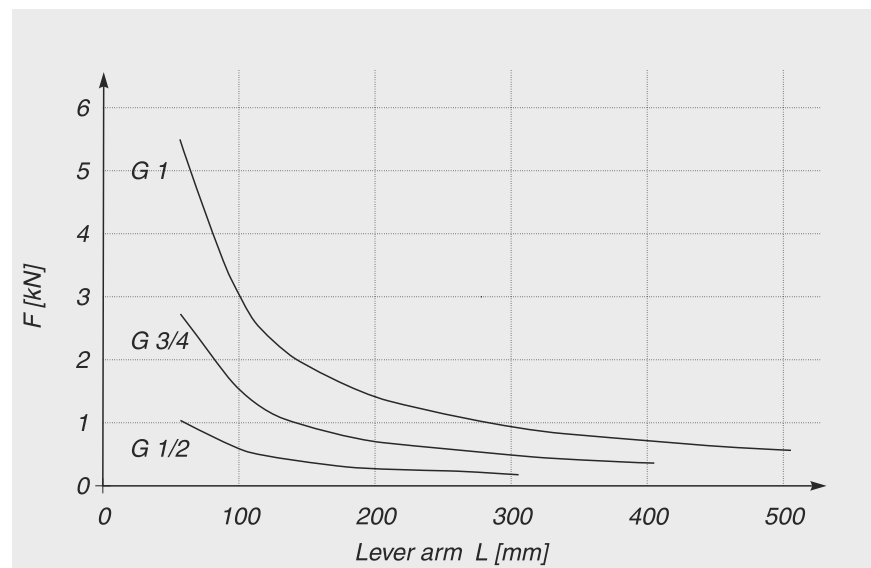

Thread acc. to DIN ISO 228

$\sigma_{adm} \leq 160 \text{ N/mm}^2$   
 $f_{adm} \leq 3 \text{ mm}$

Anchor loads have to be calculated separately.

Thread	Permissible Load (tension) [kN]	Permissible Bending Moment [Nm]
G 1/2	18.0	53
G 3/4	28.3	138
G 1	41.4	277

### Basics for heavy duty fixings

#### Tensile zone (cracked concrete)

The crack width usually is approx. 0.3 ... 0.5 mm.

Tensile stress can cause cracks in all concrete parts of a building.

Areas particularly affected by tensile stress include the underside of slabs, and walls / columns under bending stresses.

Unless proven as a compression zone, all areas of concrete into which fixings and anchors are installed must be considered as cracked concrete.

#### Approvals

Anchorage must be dimensioned and calculated according to European Approvals (**ETA**). The guidelines for these approvals are known as ETAGs and often statements on the characteristic load resistance of fixings to cracked concrete in the case of fire, can also be found here.

#### Function of Fixings

Anchors in cracked concrete have additional security through;

- automatic secondary expansion in case of crack expansion
- form locking by an undercut drill hole

#### Types of installation

Push-through installation  
(Bolt Anchor)

Pre-positioned installation  
(internal thread anchor)

Stand-off installation  
(Bolt Anchor)

[Source: MKT]

### Basics for heavy duty fixings

#### Axial spacing, edge distance, pull-out cone

- s = Axial spacing > red s = reduced axial spacing (in case of partial overlap of theoretical pull-out cones)
- c = Edge distance
- h = Component thickness
- $F_z$  = permissible loading (also  $N$  = normal force)

In the event of "concrete cone failure", a symmetrical cone of the concrete breaks away. The anchor depth  $h_v$  is therefore a determining factor in the load capacity.

#### Types of loading

#### Basic rules for anchorages

- ① Load capacity: Anchor type, base material strength and drill hole positions typically determine the load resistance of the anchorage.
- ② Concrete tensile area: The load values often refer to the anchor performance in a concrete base material of class C20/25 (formerly B25).
- ③ Corrosion protection: Electro-galvanised anchors are typically only used only for dry indoor environments. For damp environments and outdoors, anchors hot dip galvanised or made of stainless steel are typically specified.
- ④ Fire protection: According to TRGI, the anchors for gas pipes must be manufactured from non-combustible steel; equally for fire protection of fixings according to comments from MLAR.

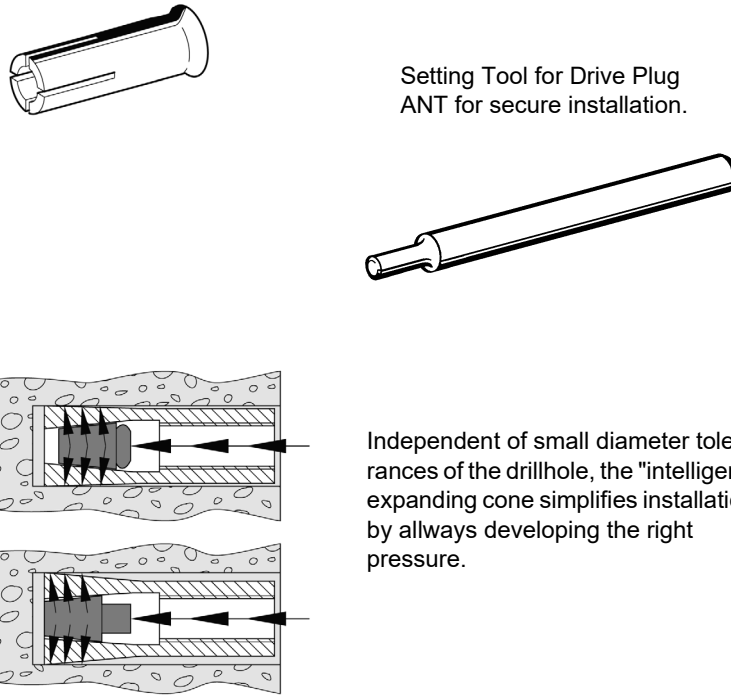

#### Anchors for multiple use in non-structural applications

According to **ETAG** - part 6, a multiple fixing is existant when a pipeline has at least 3 fixings and the loading per point is max. 2 kN.  
**ETAG** = Guide line for European Technical Approvals (ETA)

### Installation instructions Drive Plug AN and Bolt Anchor AN BZ PLUS

**Drive Plug AN ES**

Setting Tool for Drive Plug AN ES for secure installation.

Independent of small diameter tolerances of the drillhole, the "intelligent" expanding cone simplifies installation by always developing the right pressure.

European Approvals (ETA) for multiple fixings used in non-structural systems in cracked concrete.

Load capacity is reduced in considering performance under exposure to fire.

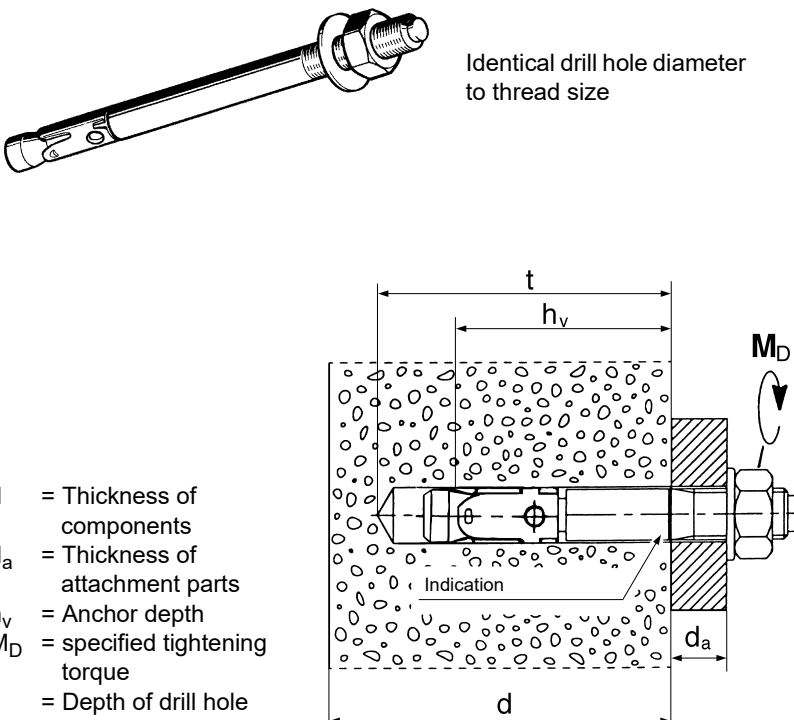

#### Advantages

- no special drill bit
- low impact energy when setting fixing
- suitable for pre-positioned installation.

#### Installation

- 1) Drill hole
- 2) Clean out the drilled hole
- 3) Set Drive Plug AN ES with Setting Tool ANT
- 4) Place installation item and connect to Drive Plug AN ES with correct length of threaded bolt or stud, and tightening torque.

**Bolt Anchor AN BZ PLUS**

Identical drill hole diameter to thread size

$d$  = Thickness of components  
 $d_a$  = Thickness of attachment parts  
 $h_v$  = Anchor depth  
 $M_D$  = specified tightening torque  
 $t$  = Depth of drill hole

European Approvals (ETA) for multiple fixings used in non-structural systems in cracked concrete.

Load capacity is reduced in considering performance under exposure to fire.

#### Advantages

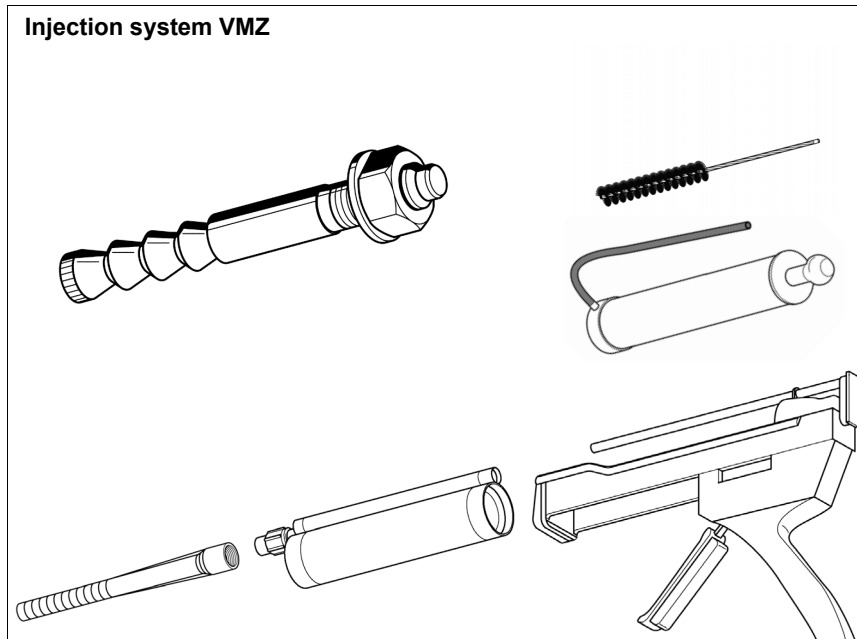

- no special drill bit
- low impact energy when setting fixing
- suitable for pre-positioned installation.

#### Installation

- 1) Drill hole
- 2) Clean out the drilled hole
- 3) Set Drive Plug AN ES with Setting Tool ANT
- 4) Place installation item and connect to Drive Plug AN ES with correct length of threaded bolt or stud, and tightening torque.

### Installation of Resin Anchor System

**Injection system VMZ**

Resin and hardener are mixed together in the mixer nozzle during dispensing from the cartridge. From the bottom depth of the drill hole, inject the resin to fill a minimum of 2/3rds of the hole.

European Approvals (ETA) for multiple fixings used in non-structural systems in cracked concrete.

Load capacity is reduced in considering performance under exposure to fire.

#### Advantages

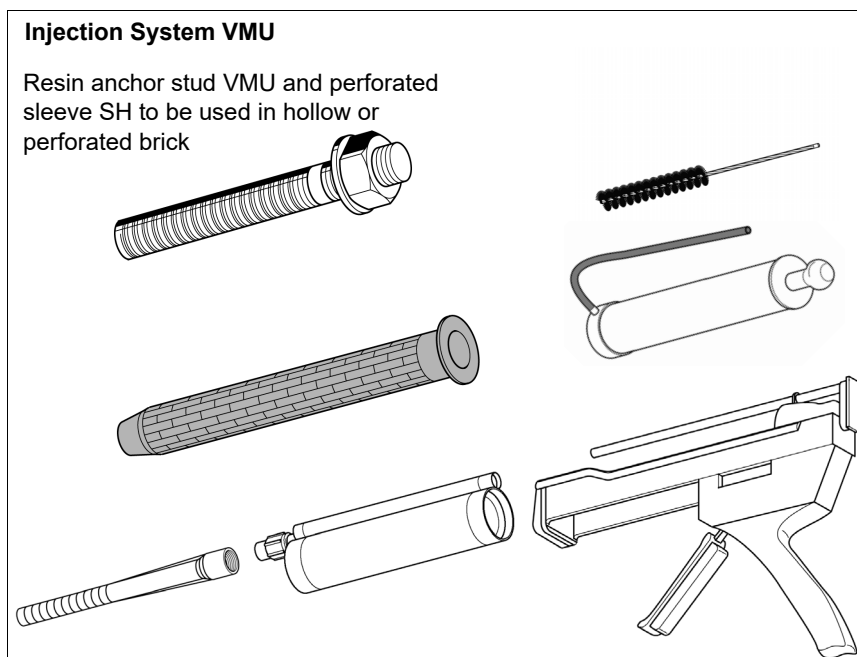

- no special drill bit
- unabated carrying capacity in wet drill holes
- processing from M12 on, even in water-filled drill hole
- processing temperature up to -5°C
- High load capacity with small edge distances and axial spacings

#### Installation

- 1) Drill hole
- 2) Brush out debris from the drilled hole
- 3) Blow out dust from the drilled hole
- 4) Fill the injection resin to the drilled hole
- 5) Screw in the anchor rod to the correct depth within the resin-filled hole
- 6) Allow resin to cure for the correct time (according to ambient installation temperature on site)
- 7) Affix connecting part and tighten down nut to specified torque.

**Injection System VMU**

Resin anchor stud VMU and perforated sleeve SH to be used in hollow or perforated brick

Suitable for brickwork (solid brick, sand-lime brick) and in combination with the Perforated Sleeve SH for:

- vertically perforated brick
- perforated sand-lime brick
- hollow brick made of gas concrete and concrete.

European Approval (ETA) for single fixation in uncracked concrete, general building inspection approval for anchorage in brickwork

#### Advantages

- no special drill bit
- Fixings possible to wet drill holes
- High load capacity with relatively small edge distances and axial spacings.

#### Installation

- 1) Drill hole
- 2) Brush out debris from the drilled hole
- 3) Blow out dust from the drilled hole
- 4) Install the perforated sleeve to the drilled hole (recommended for perforated brick)
- 5) Fill the injection resin to the perforated sleeve (100% fill)
- 6) Screw in the anchor rod to the correct depth within the resin-filled sleeve
- 7) Allow resin to cure for the correct time (according to ambient installation temperature on site)
- 8) Affix connecting part and tighten down nut to specified torque.

### Installation Instructions Hollow Core Anchor Bolt

#### Hollow core anchor AN Easy

The anchor could be used, even if the bracing area is not inside the hollow chamber.

When tightening the screw, the conus is released from the anchor sleeve, roped in and tensed up

$$B_h \leq 4.2 * B_{st}$$

General building inspection approval of the DIBt for single fixation in prestressed concrete-hollow ceilings with stability  $\geq C 45/55$ .

Considering reduced resilience suitable for exposure to fire.

#### Advantages

- no special drill needed
- suitable for the assembly of standard bolts and threaded rods

#### Installation

- 1) Drill the bore hole
- 2) Drive in anchor flushy
- 3) After tightening to specified torque, directly resilient.

#### Screwbolt TSM-ST

Suitable for installation to concrete and masonry (sand-lime brick, solid brick, clinker and natural stone)

#### Screwbolt TSM-LP VZ 30

ideal for the installation of Channel 27 to concrete and masonry Torx® -Connection T30 for a safe transfer of high torque during installation.

The screwbolt may be adjusted and is also removable.

European approval (ETA) for single fixation in cracked concrete.

Load capacity is reduced in considering performance under exposure to fire.

#### Advantages

- minimal drilling effort (small diameter and short embedment depths)
- small edge and axial spacings possible
- removable fixing

#### Installation

- 1) Drill the hole
- 2) Clean the drilled hole
- 3) Install with screw gun or impact driver.
